

Scenario A: Basic mixed workload

Input

Quantum = 2

Process	AT	BT
P1	0	5
P2	1	3
P3	2	1
P4	3	2

Analysis

- **Lower average waiting time:** SJF
- **Lower average response time:** Round Robin
- **Fairness:** Round Robin is fairer because all processes get CPU slices
- **Short job efficiency:** SJF completes short jobs earlier
- **Quantum effect:** Small quantum improves responsiveness but increases context switching
- **Recommendation:**
SJF is better for minimizing waiting time, but RR is better for interactive systems

Conclusion

- SJF performed better in waiting time and turnaround time.
- Round Robin appeared more balanced across processes.
- SJF was more efficient in handling shorter jobs.
- The chosen quantum in Round Robin caused time slicing, which increased waiting for short processes.
